

Project Design Phase
Proposed Solution

Date	03 November 2025
Team ID	NM2025TMID03627
Project Name	To Supply Leftover Food to Poor
Maximum Marks	2 Marks

Proposed Solution Template:

S.No.	Parameter	Description
1.	Problem Statement	Large quantities of surplus food from restaurants, events, and households are wasted daily, while many people suffer from hunger. There is no efficient system to connect food donors with beneficiaries quickly, leading to food waste and missed opportunities to help the needy.
2.	Idea	A Salesforce platform connects food donors with recipients (NGOs, shelters). Donors create food listings with details like quantity and location. The system automatically matches donors with nearby recipients and sends notifications. Volunteers are assigned for pickup and delivery, with real-time tracking available.
3.	Uniqueness	Uses Salesforce automation to provide end-to-end food donation management with automated matching, instant notifications, and real-time tracking—all in one simple platform without external plugins.
4.	Social Impact	Reduces food waste and addresses community hunger. Donors contribute to social good, recipients receive timely food assistance, and the transparent system builds trust among all users.
5.	Business Model	Free for individuals and small NGOs. Premium subscriptions for large restaurants/corporates for advanced analytics. Additional revenue through CSR partnerships and sponsorships from food industry companies.
6.	Scalability of the Solution	Can be easily expanded to new cities and regions. Features like nutrition tracking, expiry alerts, and food bank integration can be added. The cloud platform handles growth from dozens to thousands of users.

Solution Description:

To address food waste and hunger, a Salesforce-based platform streamlines surplus food collection and distribution. Donors (restaurants, event organizers, households) create listings with food details—type, quantity, expiry time, and pickup location. The system's automated matching engine identifies nearby recipients based on location and food requirements, then sends instant notifications via SMS or email.

Once a recipient confirms, a volunteer is assigned for pickup and delivery. All parties track the donation status in real-time through the mobile app, with updates at each stage—pickup, transit, and delivery. This approach uses Salesforce's native features including custom objects, automated workflows, and mobile capabilities, requiring no external plugins.

The solution ensures efficiency and transparency, reducing food waste while feeding those in need, and creates accountability through complete tracking from donation to delivery.

Conclusion:

This Salesforce-based food donation platform provides a practical solution to two critical problems—food waste and hunger. By automating the connection between donors and recipients, the system eliminates coordination delays and ensures timely food distribution. The real-time tracking and transparency features build trust among all stakeholders, while the scalable cloud architecture allows easy expansion to serve more communities. This solution demonstrates how technology can be leveraged for social good, creating measurable impact by reducing waste, feeding the hungry, and fostering a culture of sharing and compassion in society.
