

Project Design Phase
Solution Architecture

Date	03 November 2025
Team ID	NM2025TMID03627
Project Name	To Supply Leftover Food to Poor
Maximum Marks	4 Marks

Solution Architecture:

Goals of the Architecture:

- Connect food donors with people in need
- Track food donations from start to finish
- Automate notifications and matching process
- Reduce food waste and help hungry people

Key Components:

- **Food Donor records** (restaurants, events, homes)
- **Beneficiary records** (NGOs, needy individuals)
- **Food Listings** (available surplus food details)
- **Distribution tracking** (pickup to delivery)
- **Automated workflows** (matching and notifications)
- **Mobile app** (for volunteers and field updates)

Development Phases:

1. Create donor and beneficiary profiles
2. Build food listing and request forms
3. Implement automated matching system
4. Test donation workflow (listing to delivery)

 Solution Architecture Description:

The solution uses Salesforce to connect food donors with people who need food. When a restaurant or household has leftover food, they create a listing in the system with details like quantity, type, and pickup location. The system automatically finds nearby NGOs or beneficiaries who need that type of food and sends them notifications.

Once a recipient accepts, a volunteer is assigned to pick up the food and deliver it. Everyone can track the status in real-time through the mobile app. The system prevents food waste, ensures transparency, and helps feed hungry people efficiently.

How it works:

1. Donor lists available food
2. System matches with nearby recipients
3. Notifications sent automatically
4. Volunteer picks up and delivers

5. Distribution recorded with photos/confirmation

This architecture eliminates manual coordination, provides tracking for accountability, and scales as more donors and recipients join the network.
